Chapter 5: Chord Recognition

- 5.1 Basic Theory of Harmony
- 5.2 Template-Based Chord Recognition
- 5.3 HMM-Based Chord Recognition
- 5.4 Further Notes

In Chapter 5, we consider the problem of analyzing harmonic properties of a piece of music by determining a descriptive progression of chords from a given audio recording. We take this opportunity to first discuss some basic theory of harmony including concepts such as intervals, chords, and scales. Then, motivated by the automated chord recognition scenario, we introduce template-based matching procedures and hidden Markov models—a concept of central importance for the analysis of temporal patterns in time-dependent data streams including speech, gestures, and music.

Dissertation: Tonality-Based Style Analysis

Christof Weiß

*Computational Methods for Tonality-Based Style Analysis of
Classical Music Audio Recordings*

PhD thesis, Ilmenau University of Technology, 2017

Chapter 5: Analysis Methods for Key and Scale Structures

Chapter 6: Design of Tonal Features

Recall: Chroma Features

- Human perception of pitch is periodic
- Two components: **tone height** (octave) and **chroma** (pitch class)

Chromatic circle

Shepard's helix of pitch

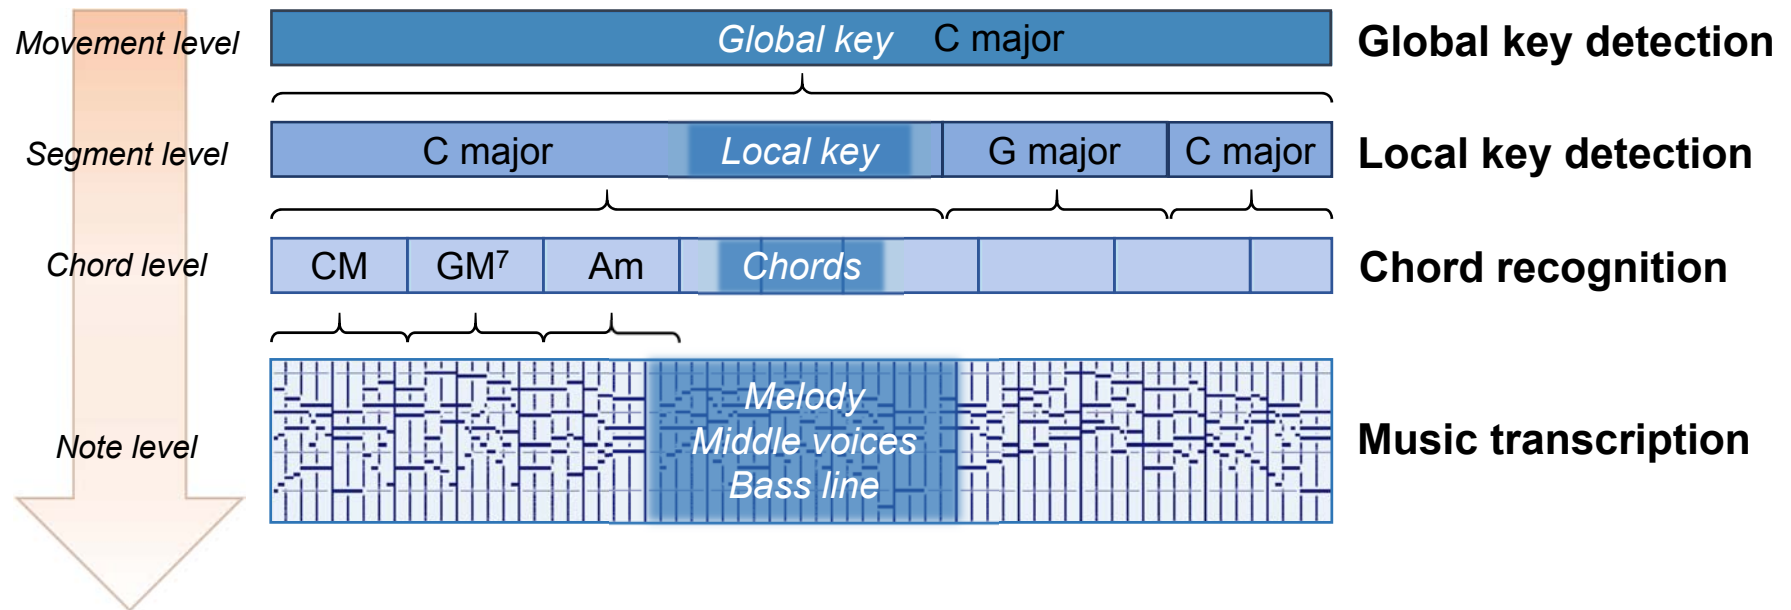

Recall: Chroma Features

Harmony Analysis: Overview

- Western music (and most other music): Different aspects of harmony
- Referring to different time scales

Chord Recognition

Let It Be chords
The Beatles 1970 (Let It Be)

[Intro]

C G Am F C G
F C Dm C

[Verse 1]

 C G Am F
When I find myself in times of trouble, Mother Mary comes to me
C G F C Dm C
Speaking words of wisdom, let it be

 C G Am F
And in my hour of darkness, she is standing right in front of me
C G F C Dm C
Speaking words of wisdom, let it be

[Chorus]

C Am G F C
Let it be, let it be, let it be, let it be
C G F C Dm C
Whisper words of wisdom, let it be

Chord Recognition

C G Am F C G F C

The image displays a musical score in 4/4 time, consisting of two staves: a treble clef staff and a bass clef staff. Above the treble staff, the chords C, G, Am, F, C, G, F, and C are labeled. The treble staff contains chord voicings and melodic lines, while the bass staff contains a simple bass line. Below the musical score is a blue waveform representing the audio signal, with a horizontal axis from 0 to 12. Vertical dashed lines mark the boundaries of the eight chords. At the bottom, a sequence of eight colored boxes contains the chord labels: C (orange), G (green), Am (pink), F (cyan), C (orange), G (green), F (cyan), and C (orange). The boxes are aligned with the chord changes in the waveform above.

Chord Recognition

Chord Recognition

Chord Recognition: Basics

- Musical chord: Group of three or more notes
- Combination of three or more tones which sound simultaneously
- Types: triads (major, minor, diminished, augmented), seventh chords...
- Here: focus on major and minor triads

→ **C Major (C)**

Chord Recognition: Basics

- Musical chord: Group of three or more notes
- Combination of three or more tones which sound simultaneously
- Types: triads (major, minor, diminished, augmented), seventh chords...
- Here: focus on major and minor triads

The image displays two musical staves in treble clef, illustrating the construction of C Major and C Minor triads. The C Major triad is shown with notes C4, E4, and G4, labeled as Root note, Major third, and Fifth. The C Minor triad is shown with notes C4, Bb3, and G4, labeled as Root note, Minor third, and Fifth. The notes are represented by whole notes on a five-line staff.

Major Root note Major third Fifth **C Major (C)**

Minor Root note Minor third Fifth **C Minor (Cm)**

- Enharmonic equivalence: 12 different root notes possible → **24 chords**

Chord Recognition: Basics

Chords appear in different forms:

- Inversions

- Different voicings

- Harmonic figuration: Broken chords (arpeggio)

- Melodic figuration: Different melody note (suspension, passing tone, ...)
- Further: Additional notes, incomplete chords

Chord Recognition: Label Assignment

Chord Recognition: Evaluation

C G Am F C G F C

Chord Recognition: Evaluation

- “No-Chord” annotations: not every frame labeled

- Different evaluation measures:

- Precision:

$$P = \frac{\#TP}{\#TP + \#FP}$$

- Recall:

$$R = \frac{\#TP}{\#TP + \#FN}$$

- F-Measure (balances precision and recall):

$$F = \frac{2 \cdot P \cdot R}{P + R}$$

- Without “No-Chord” label: $P = R = F$

Chord Recognition: Smoothing

- Apply average filter of length $L \in \mathbb{N}$:

C Dm G C

A musical score for piano in 4/4 time, consisting of four measures. The chords are C, Dm, G, and C. The right hand plays a rhythmic pattern of eighth notes, and the left hand plays a bass line with chords.

Chord Recognition: Smoothing

- Evaluation on all Beatles songs

Markov Chains

- Probabilistic model for sequential data
- **Markov property**: Next state only depends on current state (no “memory”)
- Consist of:
 - Set of states (hidden)
 - State transition probabilities →
 - *Initial state probabilities*

Markov Chains

Notation:

States α_i for $i \in [1: I]$

State transition probabilities a_{ij}

A	α_1	α_2	α_3
α_1	a_{11}	a_{12}	a_{13}
α_2	a_{21}	a_{22}	a_{23}
α_3	a_{31}	a_{32}	a_{33}

Initial state probabilities c_i

C	α_1	α_2	α_3
c_1	c_2	c_3	

β_k for $k \in [1: K]$

Markov Chains

- Application examples:
 - Compute probability of a sequence using given a model (evaluation)
 - Compare two sequences using a given model
 - Evaluate a sequence with two different models (classification)

Hidden Markov Models

- States as **hidden** variables
- Consist of:
 - Set of states (hidden)
 - State transition probabilities →
 - *Initial state probabilities*

Hidden Markov Models

- States as **hidden** variables

- Consist of:

- Set of states (hidden)
- State transition probabilities →
- Initial state probabilities*
- Observations (visible)

Hidden Markov Models

- States as **hidden** variables

- Consist of:

- Set of states (hidden)

- State transition probabilities

- Initial state probabilities*

- Observations (visible)

- Emission probabilities

Hidden Markov Models

Notation:

States α_i for $i \in [1: I]$

State transition probabilities a_{ij}

A	α_1	α_2	α_3
α_1	a_{11}	a_{12}	a_{13}

Markov Chains

- Analogon: the student's life
- Consists of:
 - Set of states (hidden)
 - State transition probabilities →
 - *Initial state probabilities*

Hidden Markov Models

- Analogon: the student's life
- Consists of:
 - Set of states (hidden)
 - State transition probabilities →
 - *Initial state probabilities*
 - Observations (visible)
 - Emission probabilities →

Hidden Markov Models

- Only observation sequence is visible!

Different algorithmic problems:

- **Evaluation problem**
 - Given: observation sequence and model
 - Calculate how well the model matches the sequence
- **Uncovering problem:**
 - Given: observation sequence and model
 - Find: optimal hidden state sequence
- **Estimation problem** („training“ the HMM):
 - Given: observation sequence
 - Find: model parameters
 - Baum-Welch algorithm (Expectation-Maximization)

Uncovering problem

- Given: observation sequence $O = (o_1, \dots, o_N)$ of length $N \in \mathbb{N}$ and HMM θ (model parameters)
- Find: optimal hidden state sequence $S^* = (s_1^*, \dots, s_N^*)$
- Corresponds to chord estimation task!

Observation sequence $O = (o_1, o_2, o_3, o_4, o_5, o_6)$

Uncovering problem

- Given: observation sequence $O = (o_1, \dots, o_N)$ of length $N \in \mathbb{N}$ and HMM θ (model parameters)
- Find: optimal hidden state sequence
- Corresponds to chord estimation task!

Observation sequence $O = (o_1, o_2, o_3, o_4, o_5, o_6)$

Hidden state sequence $S^* = (s_1^*, s_2^*, s_3^*, s_4^*, s_5^*, s_6^*)$

Uncovering problem

- Given: observation sequence $O = (o_1, \dots, o_N)$ of length $N \in \mathbb{N}$ and HMM θ (model parameters)
- Find: optimal hidden state sequence
- Corresponds to chord estimation task!

Observation sequence $O = (o_1, o_2, o_3, o_4, o_5, o_6)$

Hidden state sequence $S^* = (s_1^*, s_2^*, s_3^*, s_4^*, s_5^*, s_6^*)$

Uncovering problem

- **Optimal** hidden state sequence?
 - “Best explains” given observation sequence O
 - Maximizes probability $P[O, S | \Theta]$

$$\text{Prob}^* = \max_S P[O, S | \Theta]$$

$$S^* = \operatorname{argmax}_S P[O, S | \Theta]$$

- Straight-forward computation (naive approach):
 - Compute probability for each possible sequence S
 - Number of possible sequences of length N (I = number of states):

$$\underbrace{I \cdot I \cdot \dots \cdot I}_{N \text{ factors}} = I^N$$

computationally infeasible!

Viterbi Algorithm

- Based on dynamic programming (similar to DTW)
- Idea: Recursive computation from subproblems
- Use **truncated versions** of observation sequence

$$O(1:n) := (o_1, \dots, o_n), \text{ length } n \in [1:N]$$

- Define $\mathbf{D}(i, n)$ as the highest probability along a single state sequence (s_1, \dots, s_n) that ends in state $s_n = \alpha_i$

$$\mathbf{D}(i, n) = \max_{(s_1, \dots, s_n)} P[O(1:n), (s_1, \dots, s_{n-1}, s_n = \alpha_i) \mid \Theta]$$

- Then, our solution is the state sequence yielding

$$\text{Prob}^* = \max_{i \in [1:I]} \mathbf{D}(i, N)$$

Viterbi Algorithm

- \mathbf{D} : matrix of size $I \times N$
- Recursive computation of $\mathbf{D}(i, n)$ along the column index n
- **Initialization:**
 - $n = 1$
 - Truncated observation sequence: $O(1) = (o_1)$
 - Current observation: $o_1 = \beta_{k_1}$

$$\mathbf{D}(i, 1) = c_i \cdot b_{ik_1} \quad \text{for some } i \in [1:I]$$

Viterbi Algorithm

- \mathbf{D} : matrix of size $I \times N$
- Recursive computation of $\mathbf{D}(i, n)$ along the column index n
- **Recursion:**
 - $n \in [2: N]$
 - Truncated observation sequence: $O(1:n) = (o_1, \dots, o_n)$
 - Last observation: $o_n = \beta_{k_n}$

$$\mathbf{D}(i, n) = b_{ik_n} \cdot a_{j^*i} \cdot \underbrace{P[O(1:n-1), (s_1, \dots, s_{n-1} = \alpha_{j^*}) \mid \Theta]}_{\text{must be maximal!}} \quad \text{for } i \in [1:I]$$

$$\mathbf{D}(i, n) = b_{ik_n} \cdot a_{j^*i} \cdot \mathbf{D}(j^*, n-1)$$

Viterbi Algorithm

- \mathbf{D} : matrix of size $I \times N$
- Recursive computation of $\mathbf{D}(i, n)$ along the column index n
- **Recursion:**
 - $n \in [2: N]$
 - Truncated observation sequence: $O(1:n) = (o_1, \dots, o_n)$
 - Last observation: $o_n = \beta_{k_n}$

$$\mathbf{D}(i, n) = b_{ik_n} \cdot a_{j^*i} \cdot \underbrace{P[O(1:n-1), (s_1, \dots, s_{n-1} = \alpha_{j^*}) \mid \Theta]}_{\text{must be maximal!}} \quad \text{for } i \in [1:I]$$

$$\mathbf{D}(i, n) = b_{ik_n} \cdot \underbrace{a_{j^*i} \cdot \mathbf{D}(j^*, n-1)}_{\text{must be maximal (best index } j^*)}$$

$$\mathbf{D}(i, n) = b_{ik_n} \cdot \max_{j \in [1:I]} (a_{ji} \cdot \mathbf{D}(j, n-1))$$

Viterbi Algorithm

- \mathbf{D} given – find optimal state sequence $S^* = (s_1^*, \dots, s_N^*) := (\alpha_{i_1}, \dots, \alpha_{i_N})$
- Backtracking procedure (reverse order)
- **Last element:**
 - $n = N$
 - Optimal state: α_{i_N}

$$i_N = \operatorname{argmax}_{j \in [1:I]} \mathbf{D}(i, n)$$

Viterbi Algorithm

- \mathbf{D} given – find optimal state sequence $S^* = (s_1^*, \dots, s_N^*) := (\alpha_{i_1}, \dots, \alpha_{i_N})$
- Backtracking procedure (reverse order)
- **Further elements:**
 - $n = N - 1, N - 2, \dots, 1$
 - Optimal state: α_{i_n}

$$i_n = \operatorname{argmax}_{j \in [1:I]} (a_{ji_{n+1}} \cdot \mathbf{D}(i, n))$$

Viterbi Algorithm

- \mathbf{D} given – find optimal state sequence $S^* = (s_1^*, \dots, s_N^*) := (\alpha_{i_1}, \dots, \alpha_{i_N})$
- Backtracking procedure (reverse order)
- **Further elements:**
 - $n = N - 1, N - 2, \dots, 1$
 - Optimal state: α_{i_n}

$$i_n = \operatorname{argmax}_{j \in [1:I]} (a_{ji_{n+1}} \cdot \mathbf{D}(j, n))$$

- Simplification of backtracking: Keep track of maximizing index j in

$$\mathbf{D}(i, n) = b_{ik_n} \cdot \max_{j \in [1:I]} (a_{ji} \cdot \mathbf{D}(j, n - 1))$$

- Define $(I \times (N - 1))$ matrix \mathbf{E} :

$$\mathbf{E}(i, n - 1) = \operatorname{argmax}_{j \in [1:I]} (a_{ji} \cdot \mathbf{D}(j, n - 1))$$

Viterbi Algorithm

Summary

Algorithm: VITERBI

Input: HMM specified by $\Theta = (\mathcal{A}, A, C, \mathcal{B}, B)$
Observation sequence $O = (o_1 = \beta_{k_1}, o_2 = \beta_{k_2}, \dots, o_N = \beta_{k_N})$

Output: Optimal state sequence $S^* = (s_1^*, s_2^*, \dots, s_N^*)$

Procedure: Initialize the $(I \times N)$ matrix \mathbf{D} by $\mathbf{D}(i, 1) = c_i b_{ik_1}$ for $i \in [1 : I]$. Then compute in a nested loop for $n = 2, \dots, N$ and $i = 1, \dots, I$:

$$\mathbf{D}(i, n) = \max_{j \in [1 : I]} (a_{ji} \cdot \mathbf{D}(j, n-1)) \cdot b_{ik_n}$$

$$\mathbf{E}(i, n-1) = \operatorname{argmax}_{j \in [1 : I]} (a_{ji} \cdot \mathbf{D}(j, n-1))$$

Set $i_N = \operatorname{argmax}_{j \in [1 : I]} \mathbf{D}(j, N)$ and compute for decreasing $n = N-1, \dots, 1$ the maximizing indices

$$i_n = \operatorname{argmax}_{j \in [1 : I]} (a_{ji_{n+1}} \cdot \mathbf{D}(j, n)) = \mathbf{E}(i_{n+1}, n).$$

The optimal state sequence $S^* = (s_1^*, \dots, s_N^*)$ is defined by $s_n^* = \alpha_{i_n}$ for $n \in [1 : N]$.

Initialization

$$\mathbf{D}(i, 1) = c_i \cdot b_{ik_1}$$

Recursion

$$\mathbf{D}(i, n) = b_{ik_n} \cdot \max_{j \in [1:I]} (a_{ji} \cdot \mathbf{D}(j, n-1))$$

$$\mathbf{E}(i, n-1) = \operatorname{argmax}_{j \in [1:I]} (a_{ji} \cdot \mathbf{D}(j, n-1))$$

Viterbi Algorithm: Example

HMM:

Output

Optimal state sequence

$S^* = (\alpha_1, \alpha_1, \alpha_1, \alpha_3, \alpha_3, \alpha_2)$

HMM: Application to Chord Recognition

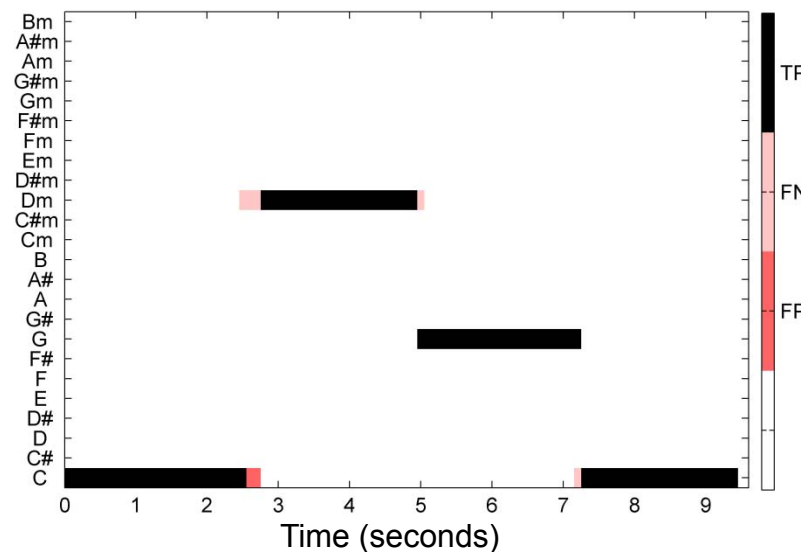

- Effect of HMM-based chord estimation and smoothing:

(a) Template Matching (frame-wise)

(b) HMM

HMM: Application to Chord Recognition

- Parameters: **Transition probabilities**
- Estimated from data

HMM: Application to Chord Recognition

- Parameters: **Transition probabilities**
- Uniform transition matrix** (only smoothing)

HMM: Application to Chord Recognition

- Evaluation on all Beatles songs

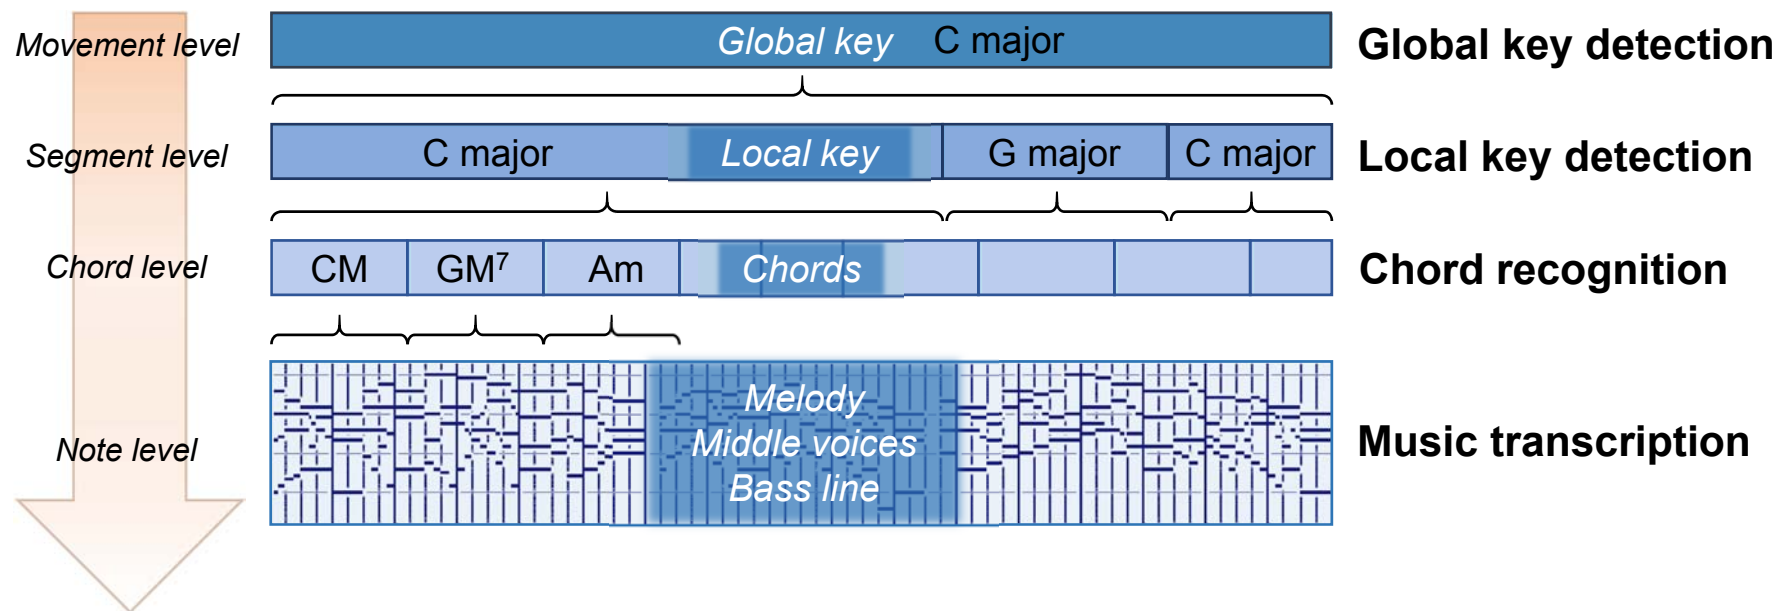

Chord Recognition: Further Challenges

- Chord ambiguities

- Acoustic ambiguities (overtones)
 - Use advanced templates (model overtones, learned templates)
 - Enhanced chroma (logarithmic compression, overtone reduction)
- Tuning inconsistency

Tonal Structures

Local Key Detection

- Key as an important musical concept (“*Symphony in C major*”)
- Modulations → Local approach
- Key relations: Circle of fifth

Local Key Detection

- Key as an important musical concept (“*Symphony in C major*”)
- Modulations → Local approach
- Diatonic Scales
 - Simplification of keys
 - Perfect-fifth relation

Local Key Detection

- Example: J.S. Bach, Choral "Durch Dein Gefängnis" (*Johannespassion*)
- **Score** – Piano reduction

Durch dein Ge-fäng-nis, Got-tes Sohn, muß uns die Frei-heit kom-men;
Dein Ker-ker ist der Gna-den-thron, die Frei-statt al-ler From-men;

9
Denn gingst du nicht die Knecht-schaft ein, müßt uns-re Knecht-schaft e-wig sein.

Local Key Detection

- Example: J.S. Bach, Choral "Durch Dein Gefängnis" (*Johannespassion*)
- **Audio** – Waveform (Scholars Baroque Ensemble, Naxos 1994)

Local Key Detection: Chroma Features

- Example: J.S. Bach, Choral "Durch Dein Gefängnis" (*Johannespassion*)
- **Audio** – Chroma features (Scholars Baroque Ensemble, Naxos 1994)

Local Key Detection: Chroma Smoothing

- Summarize pitch classes over a certain time
 - **Chroma smoothing**
 - Parameters: blocksize b and hopsize h

Local Key Detection: Chroma Smoothing

- Choral (Bach)

Local Key Detection: Chroma Smoothing

- Choral (Bach) — smoothed with $b = 4.2$ seconds and $h = 1.5$ seconds

Local Key Detection: Diatonic Scales

- Choral (Bach) — Diatonic Scale Estimation: [Multiply chroma values](#)*

Local Key Detection: Diatonic Scales

- Choral (Bach) — Diatonic Scale Estimation

Local Key Detection: Diatonic Scales

- Choral (Bach) — Diatonic Scale Estimation: **Shift to global key**

Local Key Detection: Diatonic Scales

- Choral (Bach) — 0 \triangleq 4#

Weiss / Habryka, *Chroma-Based Scale Matching for Audio Tonality Analysis*, CIM 2014

Local Key Detection: Examples

- L. v. Beethoven – Sonata No. 10 op. 14 Nr. 2, 1. Allegro — 0 \triangle 1
(Barenboim, EMI 1998)

Local Key Detection: Examples

- R. Wagner, *Die Meistersinger von Nürnberg*, Vorspiel — 0 \triangleq 0
(Polish National Radio Symphony Orchestra, J. Wildner, Naxos 1993)
